## **Surgi-Color Guard™**

### **Case Study 1**

#### **(Figure #1)**

**This patient skin graft to the lower extremity was partially removed when the dressing was prematurely removed on post-op day 2. The dressing should have been left in place for 5 days allowing the graft to adhere to the wound bed. The patient graft subsequently failed and required a second skin graft operation.**

**Figure #1**

#### **(Figure #2)**

**The patient second graft healed well.**

**Figure #2**

#### **Overall:**

**The patient required a second operation and an extended hospital stay for 5 days. The error of removing the dressing prematurely resulted in an additional \$15,000 on the patient's hospital bill.**

#### **Quantifiable Value:**

**Using Surgi-Color Guard™ on the extremity would have prevented this mistake and decreased the financial cost associated with this type of peri-operative error.**

**Study provided by Alfred T. Mitchell M.D.**
